1. Fill in the blanks below. Assume a and c are fixed constants. (Note that these are all in your text but not in this order.)**Assume**  $\lim_{x\to a} f(x)$  and  $\lim_{x\to a} g(x)$  exist.

(a) 
$$\lim_{x\to a} c =$$
  $C$   $\leftarrow$   $f(x)$  is a horizontal line

i. What do the rules above imply about  $\lim_{x\to 12}(x+\pi)$ ? =  $\lim_{x\to 12} x + \lim_{x\to 12} \pi = 12 + \pi$ 

(d) 
$$\lim_{x\to a} (f(x) - g(x)) = \begin{bmatrix} \lim_{x\to a} f(x) \end{bmatrix} - \begin{bmatrix} \lim_{x\to a} g(x) \end{bmatrix}$$

- (e)  $\lim_{x\to a} cf(x) = (c)(\lim_{x\to a} f(x))$  Take constants out side the limit.
  - i. What do the rules above imply about  $\lim_{x\to 5} 2x + 3? = 2(\lim_{x\to 5} x) + \lim_{x\to 5} 3 = 2.5 + 3 = 13$

(f) 
$$\lim_{x\to a} f(x)g(x) = \frac{\lim_{x\to a} f(x)}{\lim_{x\to a} g(x)} + \text{See} (x\to above}$$

(g) 
$$\lim_{x \to a} x^n = \underbrace{\qquad \qquad \qquad \qquad \qquad }_{x' = (x)(x)(x)\cdots(x)}$$

(h)  $\lim_{x \to a} (f(x))^n = \underbrace{\qquad \qquad \qquad }_{x \to a} \underbrace{\qquad \qquad }_{f(x)} \underbrace{\qquad \qquad }_{f(x)} = \underbrace{\qquad \qquad }_{f(x)(x)(x)\cdots(x)} \underbrace{\qquad \qquad }_{f(x)(x)(x)\cdots(x)}$ 

(i)  $\lim_{x \to a} \frac{f(x)}{g(x)} = \underbrace{\qquad \qquad \qquad }_{x \to a} \underbrace{\qquad \qquad }_{f(x)(x)(x)\cdots(x)} \underbrace{\qquad \qquad }_{f(x)(x)(x)(x)\cdots(x)} \underbrace{\qquad \qquad }_{f(x)(x)(x)(x)(x)\cdots(x)} \underbrace{\qquad \qquad }_{f(x)(x)(x)(x)(x)\cdots(x)} \underbrace{\qquad \qquad \qquad }_{f(x)(x)(x)(x)(x)\cdots(x)} \underbrace{\qquad \qquad \qquad }_{f(x)(x)(x)(x)(x)\cdots(x)} \underbrace{\qquad \qquad \qquad }_{f(x)(x)(x)(x)(x)\cdots(x)} \underbrace{\qquad \qquad \qquad }_{f(x)(x)(x)(x)(x)(x)\cdots(x)} \underbrace{\qquad \qquad \qquad }_{f(x)(x)(x)(x)(x)(x)(x)\cdots(x)} \underbrace{\qquad \qquad \qquad \qquad }_{f(x)(x)(x)(x)(x)(x)(x)(x)} \underbrace{\qquad \qquad \qquad }_{f(x)(x)(x)(x)(x)(x)(x)} \underbrace{\qquad \qquad \qquad }_$ 

(i) 
$$\lim_{x \to a} \frac{f(x)}{g(x)} = \frac{\lim_{x \to a} f(x)}{\lim_{x \to a} g(x)}$$
 provided  $\lim_{x \to a} g(x) \neq 0$ 

1

(j) 
$$\lim_{x\to a} \sqrt[n]{x} =$$
  $a^{k}$   $= \sqrt[n]{a}$ 

(k) 
$$\lim_{x \to a} \sqrt[n]{f(x)} = \frac{1}{\sqrt{f(x)}}$$
 lim  $f(x)$ 

2. If 
$$\lim_{x \to \sqrt{2}} f(x) = 8$$
 and  $\lim_{x \to \sqrt{2}} g(x) = e^2$ , then evaluate

$$\lim_{x \to \sqrt{2}} \left( \frac{g(x)}{(3 - f(x))^2} + 2\sqrt{g(x)} \right)$$

$$x) = 8 \text{ and } \lim_{x \to \sqrt{2}} g(x) = e^2, \text{ then evaluate}$$

$$\lim_{x \to \sqrt{2}} \left( \frac{g(x)}{(3 - f(x))^2} + 2\sqrt{g(x)} \right)$$

$$= \frac{e^2}{(3 - 8)^2} + 2\sqrt{e^2} = \frac{e^2}{25} + 2e$$

"plugged in"

3. Use the previous rules to evaluate (a) and explain why you cannot use the rules to evaluate (b).

(a) 
$$\lim_{w \to -\frac{1}{2}} \frac{2w+1}{w^3} = \frac{2(-\frac{1}{2})+1}{(-\frac{1}{2})^3} = \frac{0}{8} = 0$$

(b) 
$$\lim_{t\to 1} \frac{t^2+t-2}{t^2-1} = \frac{1^2+1-2}{1^2-1} = 0$$
 Rule (i)

4. (One more super-useful rule!) If 
$$f(x) = g(x)$$
 when  $x \neq 0$ , then  $\lim_{x \to a} f(x) = \lim_{x \to a} g(x)$  (provided the limits exist)!

5. Use this rule and what you know about zeros of polynomials to evaluate

$$\lim_{t \to 1} \frac{t^2 + t - 2}{t^2 - 1} = \lim_{t \to 1} \frac{(t - 1)(t + 2)}{(t - 1)(t + 1)} = \lim_{t \to 1} \frac{t + 2}{t + 1} = \frac{1 + 2}{1 + 1} = \frac{3}{2}$$
UAF Calculus 1
